Feedback and Decisions

We were looking for feedback on which features were appealing to people and which ones were likely to be unused or superfluous. Overwhelmingly, people liked the idea of choosing their own options and hotkeys. We should focus on getting the core functions of image uploading working before starting on the other functions. We will probably follow this idea through the project. People also said that text sharing would be redundant with functions that most computers already have. The feedback for the QR code functionality was that it would be neat, but not widely used, so we should pursue this later. User defined shapes would really only be well received as a lasso-type tool. This would be hard to implement, so we should also do this later. Uploading local images was well received and will be easy to do, so we should do this soon. We can probably do this as soon as the imgur api is up and running. Image editing was seen overall as something neat, but not something that was really needed. Same with tagging images with moods and stuff. These functions would probably be included with social media integration, which will be integrated after image uploading with imgur is completed.

Overall, we are more clear that our "selling point" for this tool is to have highly customizable efficient workflow of sharing images with fully featured functionalities.

Review Process Reflection

We think our review went well, we had a lot of discussion and got answers to all of our key questions, and then some. We may not have provided quite enough context since a lot of the suggested features were features of ShareX that we forgot to mention. We had a loose agenda, so sticking to it was not a problem. In the future having a working demo would help a lot since we could have people use the program and see how it feels to them.
